Giant left ventricular hydatid cyst and its surgical treatment

Ismail Cihan Ozbek¹, Kenan Sever¹, Denyan Mansuroglu¹ and Nuri Kurtoglu²

Figure 1. Cardiac magnetic resonance imaging scan of the giant cyst; ruptured germinative membrane is seen.

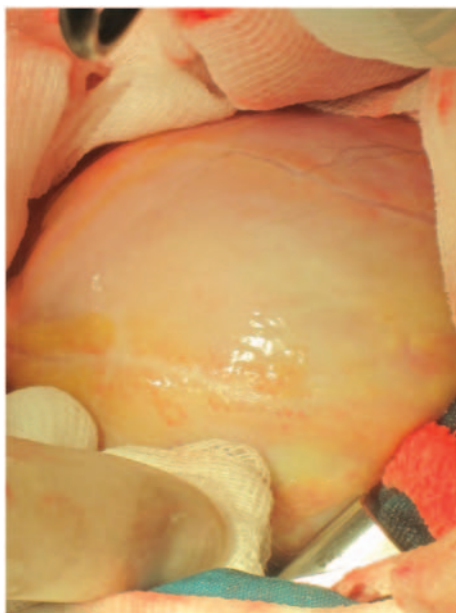

Figure 2. The left ventricular intramurally localized giant cyst.

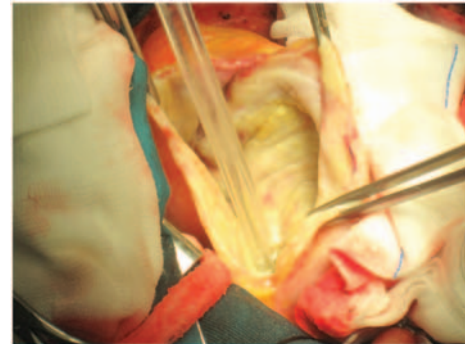

Figure 3. The left ventricle after removing the cyst.

A 41-year-old woman presented with high fever, vomiting, urticaria-like skin rash, myalgia, and fatigue. Cardiac magnetic resonance imaging demonstrated an intramural posterolaterally located left ventricular ruptured germinative membrane with a diameter of 63 mm, consistent with hydatid cyst (Figure 1), which was surgically removed (Figure 2 and 3).

Funding

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

Conflicts of interest statement

None declared.
