

Calling for cases of cats with allergic skin disease

We hope to identify whether stress can influence allergic skin disease in cats

that the cat has had skin problems for more than six months, and that prescription flea control has been used for more than six months, at the recommended frequency

We hope to identify whether stress can influence allergic skin disease in cats to therefore help reduce stress and manage the condition better in the future.

If you can help with this study, need more information or access to consent forms and questionnaires please contact Nicola Swales, e-mail: nicola.swales@bristol.ac.uk.

FELINE DERMATOLOGY

Contributing to study of cats with allergic skin disease

RESEARCHERS at the University of Bristol's veterinary school are looking for owners of cats that have been diagnosed with allergic skin disease (excluding those with flea allergy) to contribute to a study.

We would be very grateful for any help in recruiting cases to complete a questionnaire.

Inclusion criteria for the study are
