The most common symptom of aspergilloma is hemoptysis. Dry cough is a rare symptom of aspergilloma. It is estimated that 10-20% of tubercular-healed cavities are colonized by fungus. The case report discusses persistent dry cough in a 30-year-old male. Radiograph of the chest revealed left upper zone infiltrates while contrast-enhanced computed tomography of the chest revealed classical Monad sign suggestive of aspergilloma. Diagnosis was confirmed by anti-*Aspergillus* antibodies (100 IU/ml) and growth of *Aspergillus fumigatus* in sputum fungal culture.
